Steps for installations and Using of the volatility3 for Memory dump.

Application that is needed:

- Python: (get version 3)
- Git for Windows:
- Microsoft C++ Build Tools:
- Python Snappy: Pip install (adding the full path for the python snappy)
- HxD Hex editor
- Volatility 3:

Steps

1. Installed the above application
2. Clone the Volatility 3 GitHub: git clone (the GitHub address for the volatility3)
3. Change directory to volatility3 folder: cd volatility
4. Installed requirements.txt using pip install -r .\requirements.txt
5. To check the version of the Volatility installed : Python vol.py -v
6. In the volatility directory> python vol.py -f (adding the location of the memory image) windows.info
7. To pipe or save the output: python vol.py -f (adding the location of the memory image) windows.info > amg.mem.info.txt
8. To see the list in pages: python vol.py -f (adding the location of the memory image) window.pslist | more
9. To focus on specific list e.g the Chrome browser: python vol.py -f (adding the location of the memory image) windows.pslist | Select -String chrome
10. To get the help for some commands: python vol.py -f (adding the location of the memory image) windows.handles -h
11. To show the output of the dumps analysis in a folder on the system: python vol.py -f (adding the location of the memory image) -o “dump (the output directory) ” windows.dumpfile --pid 1328 (the pid number) --virtaddr 0xbf.... (the virtual address) Note: You need to create the output directory either by using the mkdir)
12. To check commands runs on the command line: python vol.py -f (adding the location of the memory image) windows.cmdline
13. To check the content of the network stat: python vol.py -f (adding the location of the memory image) windows.netstat | more
14. To check the hashdump: python vol.py -f (+ the location of the memory image) windows.hashdump
15. Remember the help if you want to use any of the plugins
